
I didn't write the code.
I directed the agents that did.
I asked the questions and made the decisions.
John Nelson · Weft

OCT 3, SATURDAY NIGHT → SUBMITTED OCT 6

64 hours

231 files

38,593 lines

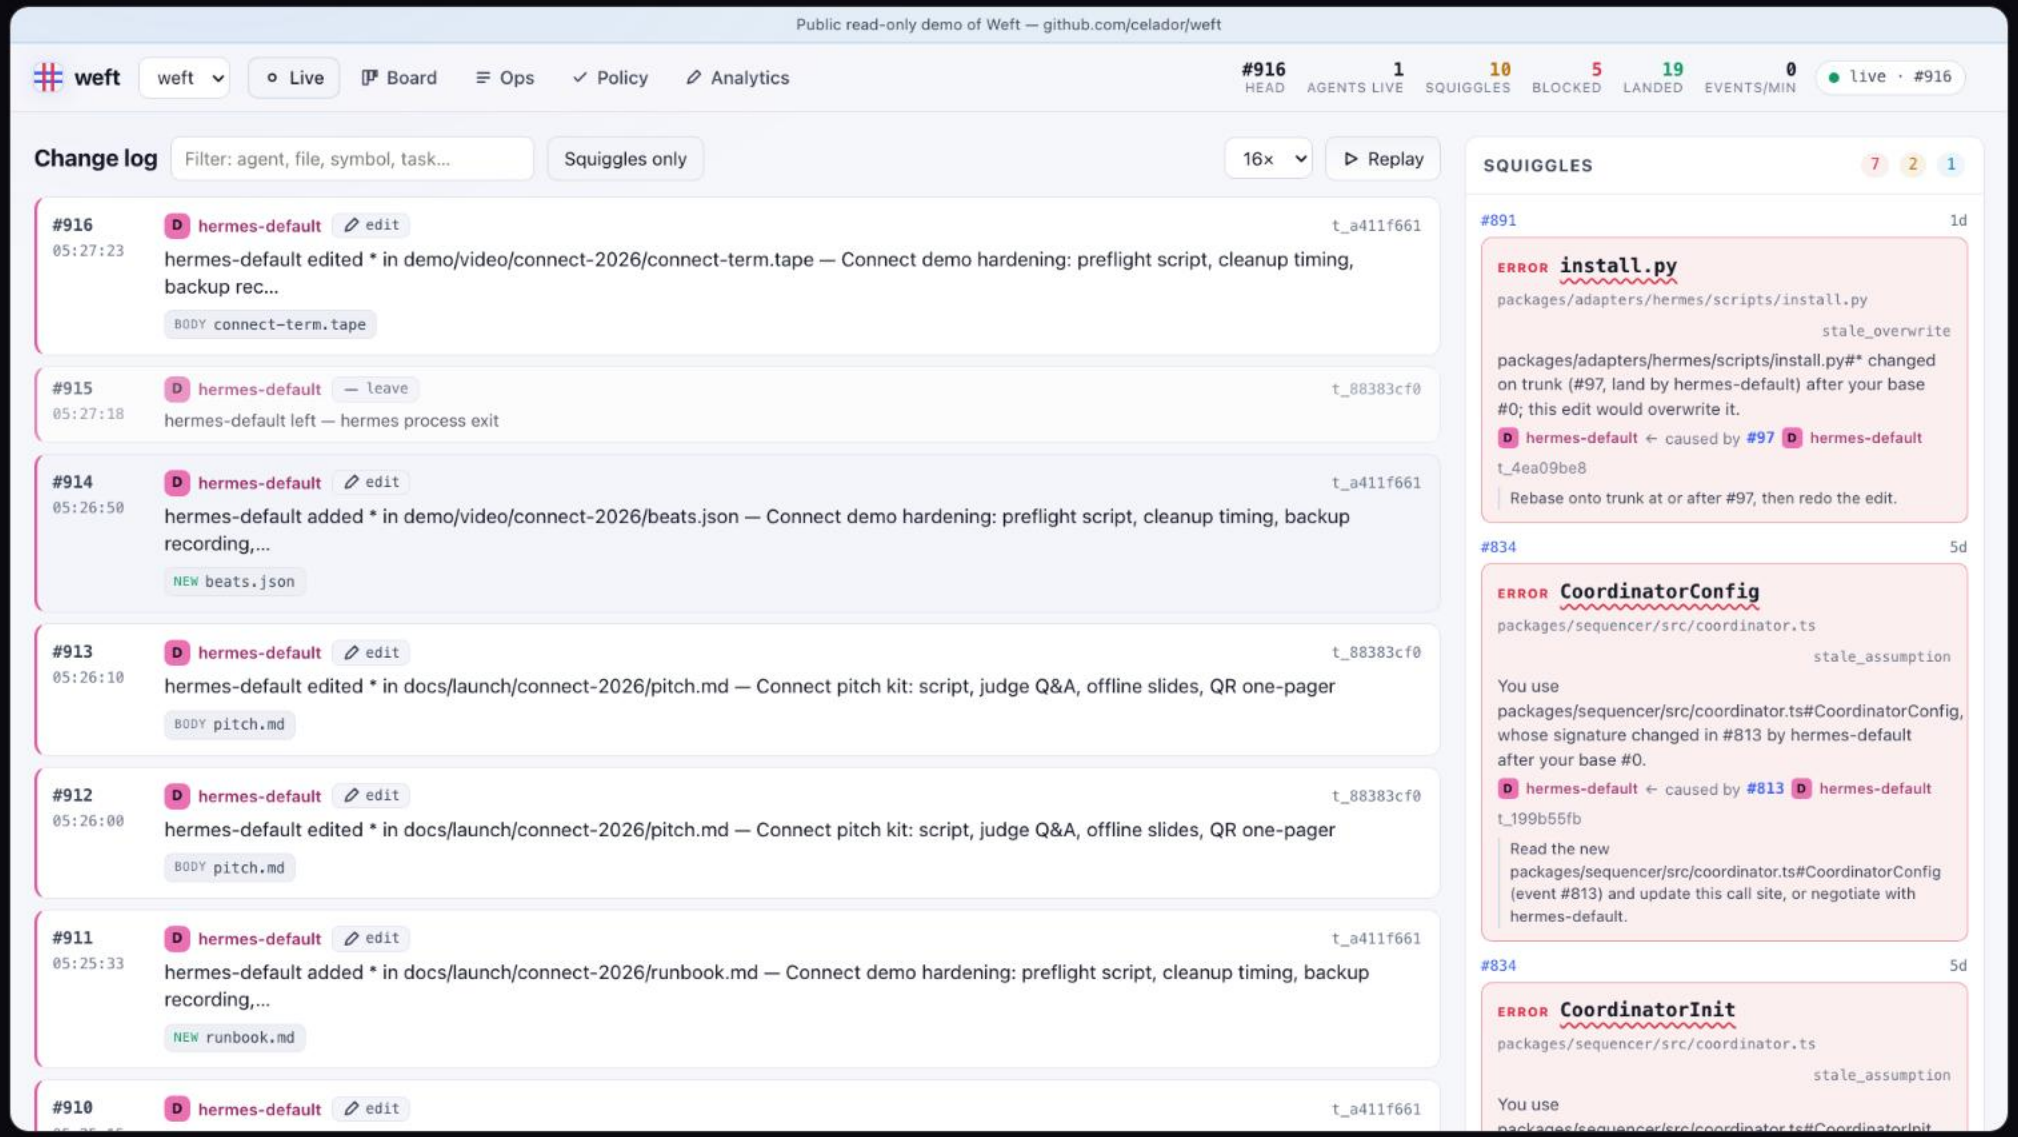

Every commit authored by an agent.

627 events

460 edits

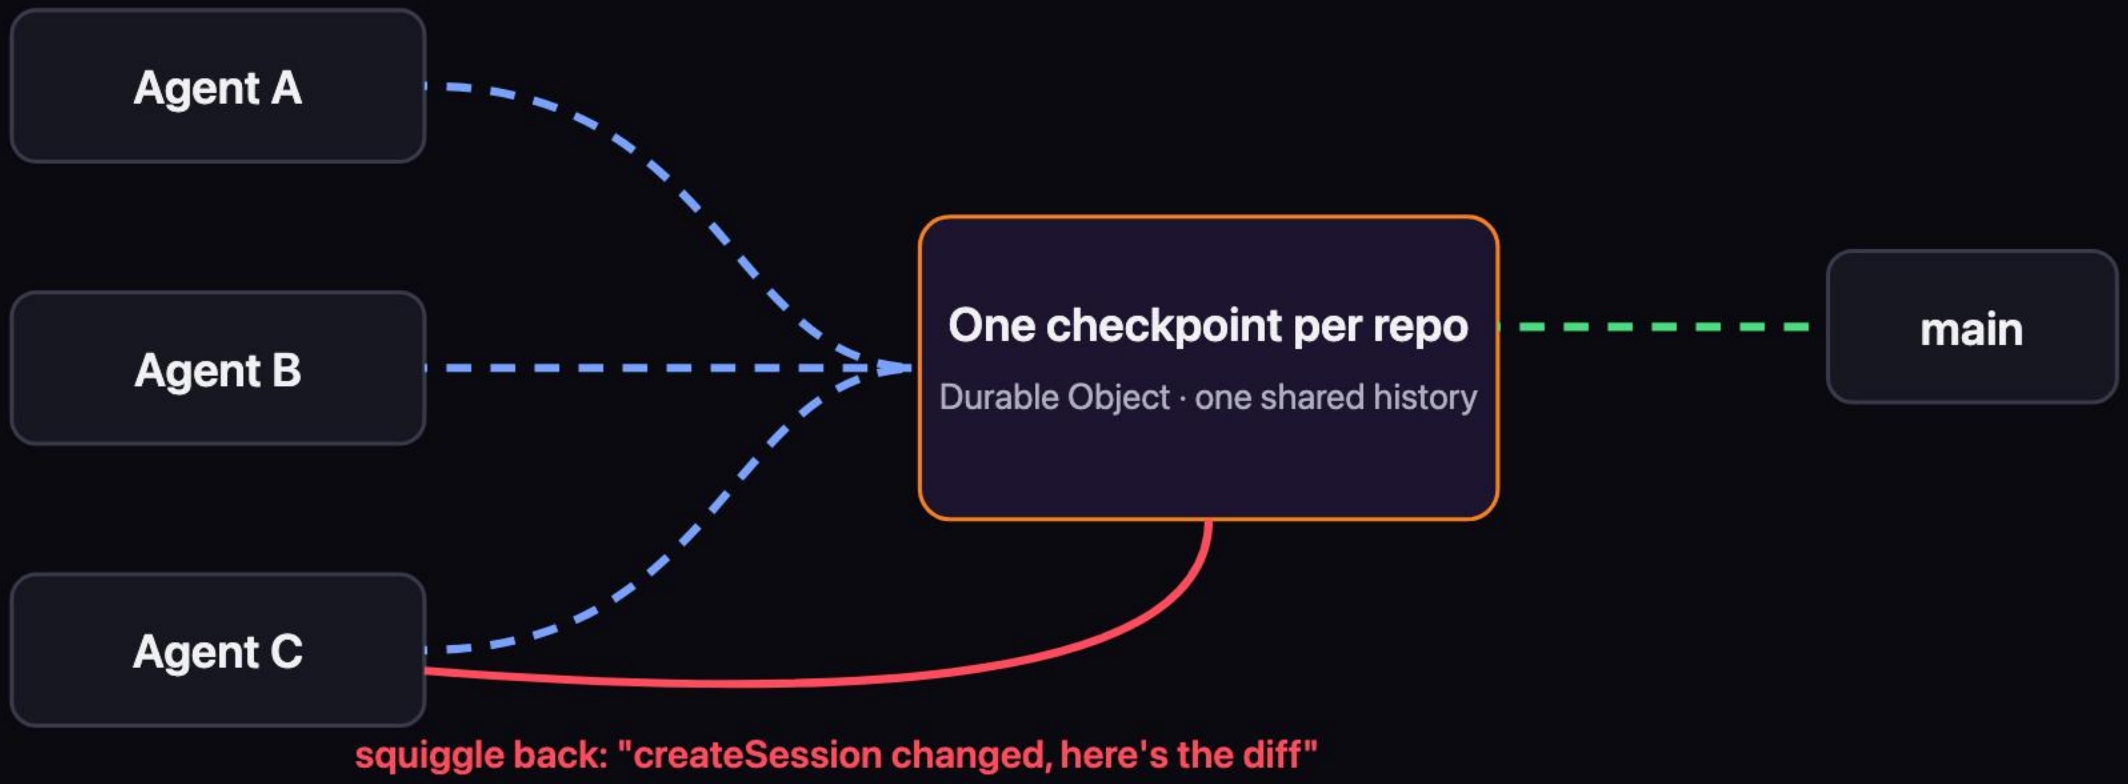

59 waits

Weft's own log, first 11.3 hours of the build

weft.elier.ai · every agent edit, in order, live

HOW IT WORKS

Not "which edit came first" but **which change breaks which**: B adopts A's new signature, then lands.

ON CLOUDFLARE · PROTOCOL RUNS ANYWHERE

Workers	API agents call + the site
Durable Object	per-repo sequencer: checks every edit
Artifacts	git storage
Workflows + Queues	land on main one at a time: rebase, test, advance

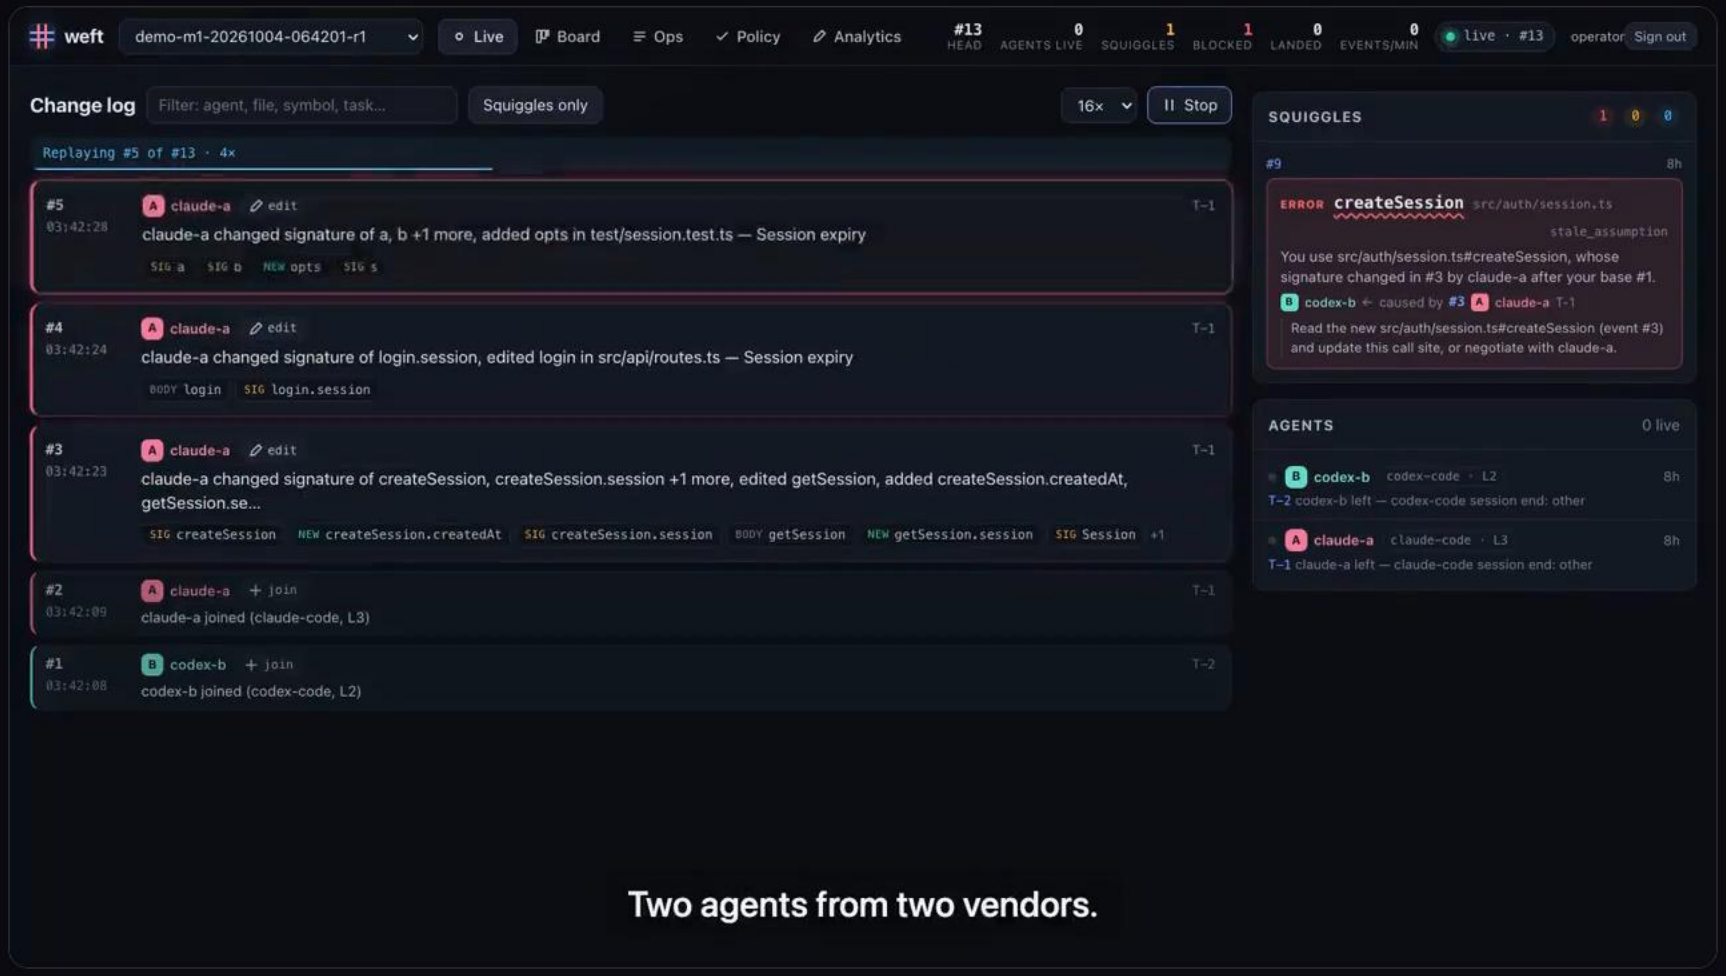

WCP, the Weft Coordination Protocol · open draft v0.1 · any harness, any host

WITHOUT WEFT · A REAL RUN

```
main $ # Without Weft. Two agents, two branches. Each passed tsc and its tests alone.
main $ git merge --no-edit agent-a  # ses
```

Both branches green alone → git merges cleanly → build breaks on main

WITH WEFT

Claude Code changes `createSession` → Codex's edit is refused → it adapts → accepted

WEFT COORDINATED THE AGENTS BUILDING WEFT

918	679	27	60	5
events	edits	landings	waits	refused

Weft's own log, to Oct 19 · event 834 refused because event 813 changed a type; next try accepted

1	2	3	4	5
Explore	Decide	Delegate	Verify	Repeat

WHY IT MATTERS

One agent is a tool. Ten agents on one repo is a **team**.

Today they find out at merge time. Weft moves it to edit time.

In two weeks: **39** stars · a stranger filed **22** issues & PRs · the Beads team asked how to integrate

Next: a **Time Machine** for agent work. Previews per revision exist; the timeline isn't built yet.

Prototype: TypeScript/JavaScript only, not in production yet

Red squiggles for teams of coding agents.

If the code editor disappears, agents still need squiggles.

weft.elier.ai

I'm looking for my next builder role.
